PLOS FORMATTING REQUESTS

For: Effects of Contact Structure on the Transient Evolution of HIV Virulence

As a Latex submission, please provide the .TEX file for your manuscript along with an updated reference PDF marked up with the changes you have made. To access your manuscript and complete these changes, please follow the link in the email we sent you. You will find the submission in "Current Task Assignments", and will need to click "Submit Task" in order to upload your corrected file(s).

This is the FINAL stage for you to copyedit your manuscript and figure files. We strongly recommend that all authors double check ALL files prior to the final versions being submitted. Changes to the manuscript, statements, author list, references, equations, or figures, including resizing, at the proof stage WILL NOT BE ACCEPTED.

Questions? Email ploscompbiol@plos.org quoting your manuscript number.

METADATA CHECK

Please confirm that the following information is correct and contact us if any changes are necessary. This information will be indexed in PubMed and published by *PLOS Computational Biology* as you have written them.

☐ Your **Author Contributions** will be typeset as follows:
- conceptualization: BMB SWP
- data curation: BMB SWP
- formal analysis: BMB SWP
- funding acquisition: BMB
- investigation: BMB SWP
- methodology: BMB SWP
- project administration:
- resources: BMB
- software: BMB SWP
- supervision: BMB
- validation:
- visualization: BMB SWP
- writing (original draft preparation): SWP
- writing (review and editing): BMB SWP

- [ ] An **Early Version** of your manuscript:
    - o WILL be published online ahead of the final version

    If you (or your institution) are planning a press release for this article, please contact us as soon as possible to ensure that an early version of your paper is not published.

- [ ] Your **competing interests** statement will be typeset as follows:
    - o The authors have declared that no competing interests exist.
- [ ] Your **data availability statement** will be typeset as follows:
    - o There are no primary data in the paper; all materials are available at https://github.com/bbolker/HIV_LHS/ and will be deposited in an appropriate archival repository (Zenodo).

**At this time please deposit your materials (if you have not already) and reply to the requests email to confirm once you have done so.

- [ ] The details of the **corresponding author** will be typeset as follows:
    - o bolker@mcmaster.ca
- [ ] Please check the **authorship and affiliations** list on the title page of your manuscript. These details will be used to index the authorship of your manuscript and therefore should be checked carefully for any errors.

- [ ] Your **title** will be typeset from the submission system, not the manuscript file. Please check that the following is correct:
    - o Effects of Contact Structure on the Transient Evolution of HIV Virulence
- [ ] Your **short title** will be typeset from the submission system, not the manuscript file. Please check that the following is correct:
    - o Contact Structure and Transient HIV Virulence

Please note that if you wish any word to be **italicised**, this will need to be manually changed in the Editorial Manager system. Please contact the journal office to address this.

MANUSCRIPT REQUIREMENTS

Please update your manuscript with the following changes:

1. Please remove the figures from your manuscript file. Only the legends should be present in the manuscript.

2. Please remove the part of the acknowledgments in which you thank the reviewers. PLOS Computational does not allow authors to thank reviewers in published papers.

3. Please remove the funding information from your acknowledgments and ensure it is correct as listed above. If changes need to be made, please let us know by replying to the requests email.

4. Please cite figures in ascending numerical order within the text. Currently Figure 2 is cited before Figure 1. If figures need to be renumbered, please ensure to update all in-text citations, legends and affected file names accordingly.

5. Since you have included your supporting figures within your S2 Appendix file, for proper linking in the published version you will need to relabel them with letters rather than numbers (A, B, C, etc. rather than S1, S2, S3, etc.) and revise the citations in the manuscript accordingly so they are in the style "Fig A in S2 Appendix" "Fig B in S2 Appendix", etc. Please note that the S_ in the Appendix label should come first.

Alternatively, you can upload each supporting figure separately and provide a legend for each figure in the manuscript (The number of legends in the manuscript should match the number of files uploaded). If you choose this option the figures can be labeled/cited as S1 Fig, S2 Fig, etc.

FIGURE REQUIREMENTS

PLOS offers a figure-checking tool, PACE (http://pace.apexcovantage.com/), to help authors to ensure all figures meet PLOS requirements so that the quality of published figures is as high as possible. **Please use this tool to help you address the requests below.**

PACE is a digital diagnostic and conversion tool for figure files. It will provide information about any failed check(s) and, if able, will automatically convert the figure file into an acceptable file that passes quality checks. PACE requires you to register for an account to ensure your figure files are processed securely.

Please complete the following instructions regarding your figure files:

-Figure 1 is a multi-panel figure. Multi-panel figures (those with parts A, B, C, and D) should be submitted as a single file that contains all parts of the figure.

-Figures 1-6 exceed the dimension limits for Figures. Figures must be less than 19.05cm in width, and less than 22.225cm in height. Please make the necessary adjustments and re-upload your Figures. In Photoshop: Image→Image Size. Make sure the Resample Image checkbox is NOT checked. If the Width is over 19.05cm, type 19.05 in the Width box (19.05cm is our maximum allowable width for figures).

In GIMP: Image→Scale Image. Set the units of measurement, in the pull down menu next to Height, to millimeters. If the Width is over 190.5mm, type 190.5 in the Width box (19.05cm is our maximum allowable width for figures) and hit Tab. The new Height of the figure will appear, scaled proportionately to the change in Width.

-Figures 1-6 are low resolution and we cannot accept your Figures as is. Please note that this problem will not be detected or corrected by the PACE tool. Please carefully review the PLoS Figure Guidelines and provide Figure files that were originally created at 300 pixels/inch (dpi) and at least 6.68cm wide, but less than 19.05cm and under 22.225cm tall. This will not be fixed by simply increasing the resolution of your Figures in the image editing software.

1) Export a PDF from PowerPoint/Word/Excel. On a Mac, click on the 'PDF' button in the printer dialog box and select 'Save as PDF'. On a PC, send the file to print and select 'Adobe PDF' or 'PDFCreator' (it's freeware) from your list of available printers.
If you are using Adobe PDF, then go to Printer Properties, Default Settings and select Press Quality.
If you are using PDFCreator, Go to 'Printer Properties' and then click on 'Advanced' on the bottom right. Under 'Graphic', go to 'Print Quality' and select 600dpi.

2) PHOTOSHOP: When you open up the PDF, make sure that the 'Constrain Proportions' box is checked. Set the 'Resolution' to 300dpi (118.11 pixels/cm) and set the 'Bit Depth' to 8 bit. Use the crop tool (next to the eyedropper) to remove unnecessary white space. Go to - Image - Image Size. Make sure the 'Constrain Proportions' and 'Resam tool (next to the eyedropper) to remove unnecessary white space. Go to 'Image' - 'Scale Imaple Image' boxes are checked.

To ensure that your Figures publish properly, please delete the alpha channels from each Figure file. In Photoshop, select it in the Channels Palette and click on the trash can icon. When you save the TIFFs make sure that the 'LZW' button is checked and 'Discard Layers and Save a Copy' button is checked.

3) GIMP: When you open up the PDF, set the resolution to 300. Use the cropge'. Make sure the chain link icon is joined together. Then change the size of your figure according to the pixel specifications mentioned in step 2) above. To ensure that your Figures publish properly, please delete the alpha channels from each Figure file. In GIMP, go to Layers - Transparency - Remove Alpha Channel. When you are done, 'SAVE AS' (or Export if GIMP 2.8). Select File Type - 1st TIFF option. Make sure to use LZW compression.

4) Print out your figures on a desktop printer. Text and graphics should appear clear and crisp with no pixelated or blurred edges.

5) If the resulting figures are still blurry, then your original source images are too low of a resolution. Please increase the resolution of your original source images, and repeat this process.

You can also upload a Striking Image to accompany your article if one is available. If this image is judged to be suitable, it may be featured on our website. Images should be high resolution, eye-catching, single panel images. If your image is from someone other than yourself, please ensure that the artist has read and agreed to the terms and conditions of the Creative Commons Attribution License. Note: we cannot publish copyrighted images.
